

Major Order for Crude Oil Pumps

As part of ongoing efforts to modernize transport of oil and gas in Austria, Vienna-based firm OMV has established a new crude oil extraction station. OMV chose for this project twenty-five ALLWEILER centrifugal pumps of the CNH-B series for pumping sedimentation products and three ALLWEILER high-pressure screw

pumps of type SMH 940 for moving processed crude through the pipeline.

This marks the first time that ALLWEILER centrifugal pumps are employed for oilfield services. OMG also chose ALLWEILER progressing cavity pumps for crude oil and gas condensate in addition to

Houttuin pumps in the refinery's tank farm. As a result, all of ALLWEILER's product lines are represented in this oil and gas "application cluster". A major factor in the customer's decision was ALLWEILER's unique ability to deliver all three pump types from its own production. ■
