

Faster deliveries with new machine

In November 2008, ALLWEILER added a new machining center to its centrifugal-pump production area. The new "NBH6+" machining center from Hüller-Hille has increased production capacity for casings and centrifugal-pump parts by a quarter, resulting in shorter delivery times. The new machine has also given ALLWEILER the ability to again manufacture all of its pump brackets in-house. "We will continue to invest in our machines and processes, despite the difficult economic environment," according to CEO Dr. Michael Matros.

These investments will ensure that the company can reliably produce high quality casings. ■
